

# FACT APP

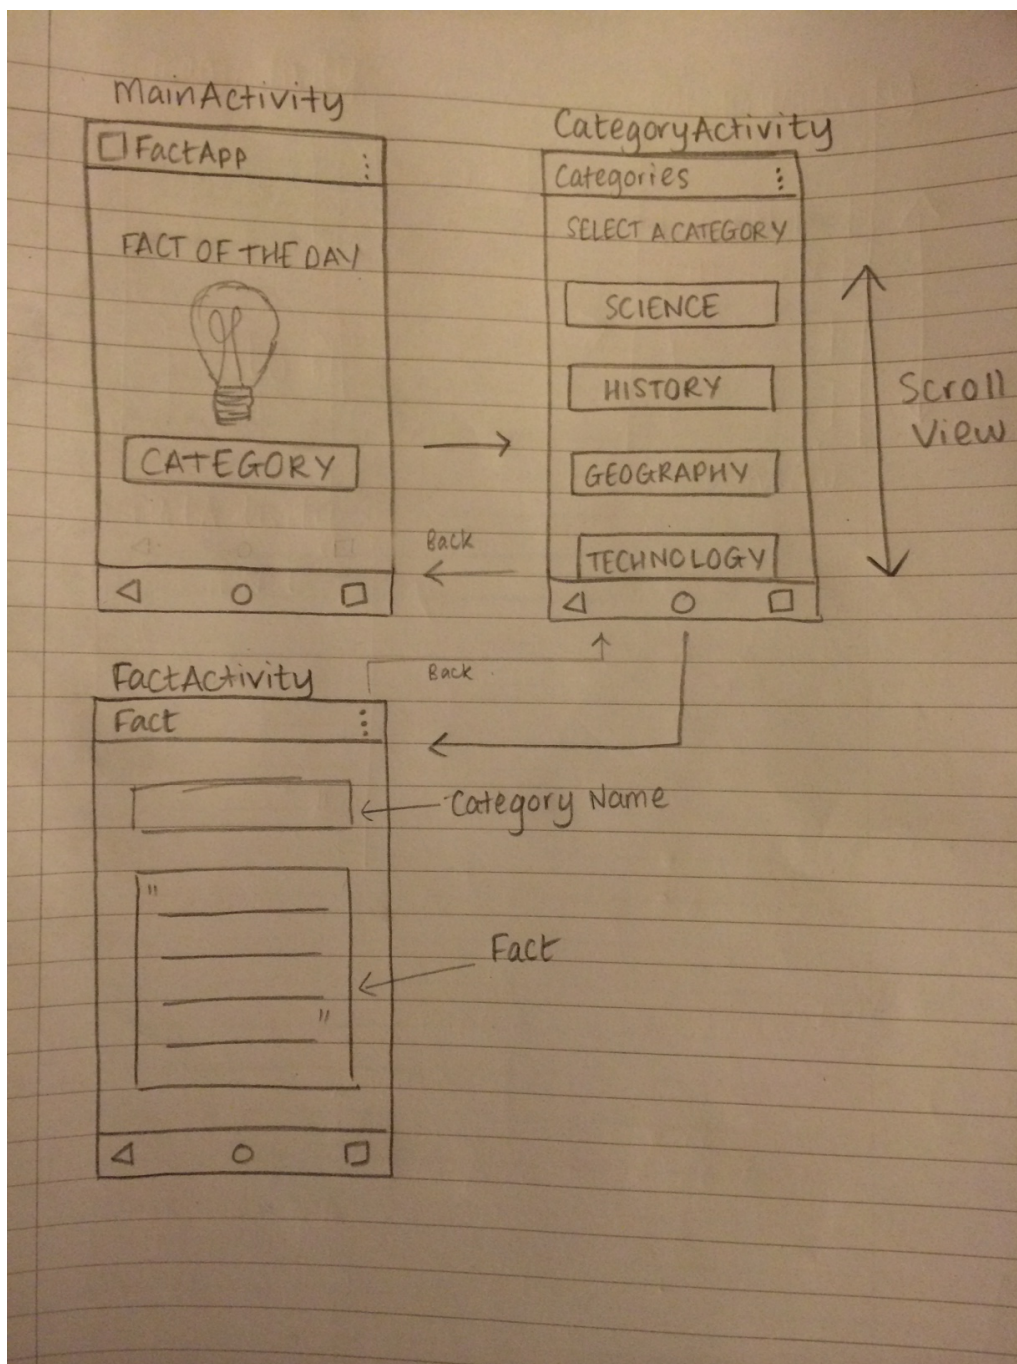

## Problem:

With the development of technology over the last few years, experts say that human intelligence is decreasing. With so much to explore on the internet, people are spending countless hours scrolling through useless information.

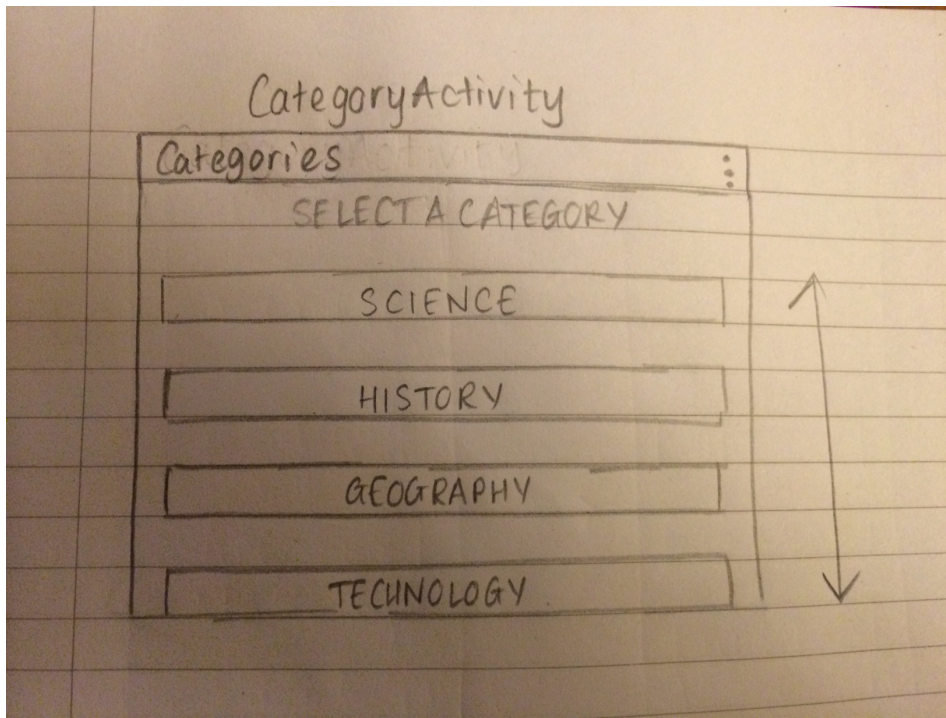

## Proposed Solution:

Design an app that provides the user with different facts about the world. It allows the user to select a category in a scroll view. After this is selected, the app chooses a random, interesting fact to display to the user depending on what category they selected. In my opinion, this will inform people more about the world around them. The app will use a simple UI and most tablet layouts will be the exact same.

## Mocks for user user-facing screens:
